

DATA FAIRNESS REFLECTION

1. Basis for Judgments

The standard used to measure community fairness is the calculated ratio of total book checkouts compared against the number of unique registered members belonging to each specific neighborhood.

2. Finding

After grouping and comparing the metrics across all regions, the Maadi neighborhood showed a noticeably lower checkout-to-member ratio relative to the other areas present in the dataset.

3. Plausible Reason

The physical library branch is likely situated geographically furthest from this neighborhood, creating travel barriers that make it inconvenient for students from that area to regularly visit and borrow books.

4. Next Step

To bridge this accessibility gap next summer, the library should organize a mobile book-drop or a pop-up reading station directly within the Maadi neighborhood to encourage higher participation.
